About Schneider-Kreuznach MPTV Filters

Welcome to Schneider-Kreuznach

Schneider-Kreuznach, represents a long history of extraordinary lenses and filters for many industries including still photography, television broadcasting, cinematography and digital projection. It's no wonder Schneider-Kreuznach filters for motion pictures and digital cinematography are the finest in the industry.

Consistent Precision

Diamond cut from crystal-clear, water-white optical glass, Schneider-Kreuznach filters are ground and polished to a precise flatness and plane-parallelism (exact parallel relationship between front and back filter surfaces). Then, to ensure perfection, this is verified by a laser interferometer. Schneider-Kreuznach filters are then checked with a densitometer for consistent density, and tested with a spectrophotometer for proper light transmission. It's due to this ultra-high consistency, that allows cinematographers to swap like filters mid-shoot with no discernible variation in color or effect. What's more, the unprecedented purity, color saturation and repeatability of Schneider-Kreuznach filters virtually eliminate the need for lab color timing correction.

Ultra Durability

Schneider-Kreuznach filters stand up to the most rigorous demands on set or location. Many feature Schneider-Kreuznach's specially formulated hard anti-reflective (AR) coating to resist flaking, peeling and scratching. This proprietary coating also reduces light loss and flare to less than 1% per surface, compared to untreated glass that has a light loss of 4% per surface. SchneiderKreuznach screw-in filters feature virtually jam-proof brass precision mounting rings, while unmounted SchneiderKreuznach laminated filters are protected against delamination and edge-chipping by SchneiderKreuznach's unique Edge Seal, which also reduces edge reflection and edge flare.

Schneider-Kreuznach Filters Work with Long Lenses

The common perception among photographers and cinematographer's is that filters should not be used in front of long length lenses, due to the critically short depth of field of these lenses. This belief is often confirmed when poorly made glass or "plastic-resin" filters are placed in front of a long lens, and the degradation of the image is visible simply by looking through the viewfinder. This degradation is caused by poor quality control, low-quality glass and poor glass grinding and polishing techniques used in the manufacture of such filters.

Schneider-Kreuznach filters have no such problems, and can be used in front of even the longest lens. Diamond-cut from high-quality optical glass, then ground and polished to precise lens-making standards, SchneiderKreuznach filters offer unsurpassed clarity, light transmission and color saturation with absolutely no visible compromise of image quality. Even when stacked, they are the clear choice for use with any lens.

Glossary

1/4" Wave Retarder

The quarter-wave retarder takes incoming linear polarized light and turns it into circularly polarized light, effectively depolarizing it and allowing it to otherwise function similarly to the unpolarized transmitted light. There is no measurable light loss associated with this, and the circularly polarized specular highlights appear identical in left and right eye cameras. Colors balance better and the 3D image quality is greatly improved.

81-One

Born from the 81-A this filter is designed to add warmth to skin tones and reduce excessive blue in outdoor open shade. It is used to accentuate skin tones for a slightly warmer appearance and is appropriate for all skin tones. Ideal for romantic close-ups, the 81-One can be combined with softening filters.

Antique Suede

Accentuates earth tones. Works well for period scenes requiring warm antique look.

Black Frost®

A fine "black" mist (similar to Black SupaFrost & Black Promist). Subtle softening of skin texture. Flairs highlights and tones down contrast while holding black level. Removes video "edge".

Classic Black Soft

Combines the benefits of Classic Soft with the subtle effects of Black Frost 1/8. Ideal for close-ups, and can be used to facilitate a seamless transition in the look and continuity from scene to scene.

Classic Soft®

Contains hundreds of Micro-Lenslets™ evenly distributed throughout the filter. Classic Softs create a unique softening effect that helps smooth-out blemishes and minimize wrinkles. The stronger grades (1 & 2) help add mood to scene by causing highlights to glow softly.

Classic Soft®, HD

Designed to allow shooting in all HD formats without fear of artifacts, the HD Classic Softs offer the same unique softening effect of the original Schneider Classic Softs.

Classic Sunset

Works with a wide range of focal lengths to enhance an existing sunset or create the illusion of an orange flame sunset where none exists.

Clear

Protect expensive front elements and other filters while providing the truest image, free of unwanted color shifts.

Color Temperature Blue

Blue filter which corrects tungsten light towards daylight. Similar to Kodak Wratten 80D and 80C series.

Glossary

Combination ND & CircPol:

Three-Stop and Four-Stop (ND) Circular Polarizer filters are efficient filters that will give you added densities for light control and polarization to minimize glare and enhance color saturation and contrast. These filters are neutral across the full color spectrum, have minimal IR light leakage, and eliminates the need to stack ND filters with a polarizer.

Day for Night

Simulate moonlight conditions. 4-stop light loss.

DigiCon™

Raises black levels while lowering highlights. Combined with in camera gamma settings and / or post production, a higher dynamic range can be recorded. The result is more detail in highlight and shadow areas with no loss of resolution or softening of the image. Filter produces no color shift and highlights are clean and halo-free.

Diopter (Close-up) Full Field

Increase the minimum working distance enabling closer focus from a greater working distance.

Diopter (Close-up) Split Field

Increase the minimum working distance enabling closer focus from a greater working distance on half of the frame.

Double Classic Black Soft

For in focus diffusion plus a heavier Black Frost effect, without filter stacking. Combines the features of the Schneider Classic Soft with a Black Frost 1/4.

Gold

For an overall warming effect. Portrays healthy skin tones & accentuates foliage.

Graduated Filter

Part clear and part color. They are designed to be used in professional matte boxes, so that they are readily positioned at the exact angle required to create desired effects.

Graduated Hard Edge

The hard graduation from the filter effect to clear can be used with telephoto lenses or for bold transitions.

Graduated Soft Edge

The soft graduated transition from the filter effect to clear on this filter can be used with wide to medium-angle lenses because these lenses have greater depth of field.

Green CC

Used for black and white cinematography. Ideal for nature cinematography, it is good for darker reds and lighter greens.

Hollywood Black Magic™

Combines the best attributes the Schneider HD Classic Soft and Black Frost filters. Pleasant softening of bright highlights helps control the exposure while maintaining rich blacks and colors.

LowCon-2000

Lowers contrast and spreads light into shadow areas.

Glossary

Mounted or Unmounted:

Certain round filters designated "Drop In" come in either Mounted or Unmounted. The Mounted filters come in unthreaded rugged aluminum rings and the Unmounted filters have no rings nor are the edge sealed.

Maui Brown

Enhances browns, golds, and foliage, while holding the overall white level. Good for skin tones. Improves color contrast in architecture and landscape with flat lighting conditions.

Neutral Density

Schneider Neutral Density (ND) filters are designed to control exposure or depth of field under various lighting conditions without affecting color or contrast. Unlike other brands, Schneider absorptive ND filters are a neutral gray, achieved with laboratory precision.

ND Attenuator

Constant graduation across the entire filter area which is most dense at the top graduating to lighter densities at the bottom. Designed to control overall exposure and/or various lighting conditions, without affecting color or contrast.

ND Combo Grad:

Help balance exposure and/or compensate for the limited dynamic range of digital cameras. In all densities, the additional soft edge is two stops more than the lower half of the filter.

ND Dual Grad

Offers a clear area separating 2 graduated ND attenuator sections. One section covering 2/3 of the glass graduates from the darker density to the central clear, while the smaller 1/3 goes from the lighter density at the edge to the clear section.

Platinum Series IRND

Removes infrared spectrum from light path for rich deep shades of black in daylight scenes combined with ND designed to control exposure or depth of field without affect color or contrast. Uses absorptive technology and is free of off-axis color shift regardless of the focal length and can be stacked without introducing reflections. Can also be used as a standard ND filter with all HD video and Film cameras. IRND filters are neutral gray and do not require additional in camera white balance.

Polarizer, Circular True-Pol®

To prevent viewfinder black-out on cameras which employ polarizing elements in the beamsplitters of the viewing system, like Arriflex 435 and MovieCam Compact.

Polarizer, Linear True-Pol®

This is by far the most effective polarizer for motion picture and television cameras. Having an extinction ratio of ER 374, the Schneider True-Pol is 12- times more effective than other polarizing filters, and is unmatched in its ability to reduce glare and unwanted reflections, saturate colors, deepen blue skies, improve contrast, and penetrate haze. True-Pol Polarizing filters enable you to achieve a level of optical performance previously unavailable to cinematographers.

Polarizer, Circular One-Stop

The One-Stop Pola filter has been updated from Linear to Circular, creating a more neutrally stable filter with better polarizing efficiency. While the standard Circular True-Pol is 1-3/5 stops, the One-Stop Circular Polarizer significantly reduces reflections while reducing available light by just one stop.

Sahara Gold

Especially useful in creating a rich warm scene for an old Technicolor look. This filter approximates 3/4 the color value of an 85 and can also replace an 81EF for a cool look. This filter holds skin tone better than an 81EF.

All prices are ex stock Munich, excluded V.A.T.

Glossary

RHOdium FSND

Full Spectrum Neutral Density filters are specially developed to meet very tight quality standards of color control by controlling IR within the visual spectrum and into the near infra-red, while remaining perfectly neutral.

Sapphire Blue

Adds indigo blue color.

Storm Blue

Adds grey green color to ocean and sky for a stormy effect.

True-Cut IR

Removes the IR spectrum from the light path for rich deep shades of black in daylight scenes. Uses reflective technology and must be stacked as the farthest filter from the lens to avoid internal lens reflections. Can cause off-axis color shift if used with wide angle lenses.

True-Match Vari-ND®

Allows the user to select the lens f/stop and camera speed independent of ambient light conditions. Works by taking two carefully matched filters and stacking them in combination to produce a density range from 1-1/3 stop loss to 11 stops of light loss with no blue color shift.

True-Streak™

Clearly the most effective and exciting way to simulate the anamorphic blue streak effect with virtually any lens, anamorphic or not. Long, brilliantly colored streaks emanate from bright lights and highlights. Available in four strengths: 1mm (strongest), 2mm, 3mm and 4mm (most subtle); and in eight colors: Blue, Red, Yellow, Orange, Green, Violet and Pink as well as Clear.

True-Streak™ Confetti

Small multi-color True-Streaks are scattered about the filter to create bursts of colors around the light source. A combination factor of the focal length of the lens and the brightness of the light source will determine the effect of this filter; from a soft colorful halo to bright bursts of multiple colors.

True-Streak™ Star

By using the Schneider True-Streak technology made with cylindrical lenses, rather than the antiquated technique of etching the glass, you're left with clean, smooth lines for diffraction efficiency in creating the Star effect.

UV-410 Haze

Reduces or eliminates photographic haze in areas where the atmospheric conditions contain a heavy concentration of dust particles, water droplets, and pollution.

White Frost:

A fine "white" mist (similar to White SupaFrost & White Promist). Lowers contrast, flairs highlights and tones down colors, while creating a subtle dream-like effect.
